Date :03/06/2025

ACKNOWLEDGEMENT

It is with great pride that I express our gratitude and in-debt to our institution “**K.Ramakrishnan College of Technology (Autonomous)**”, for providing us with the opportunity to do this project.

I glad to credit honourable chairman **Dr. K. RAMAKRISHNAN, B.E.**, for having provided for the facilities during the course of our study in college.

I would like to express our sincere thanks to our beloved Executive Director **Dr. S. KUPPUSAMY, MBA, Ph.D.**, for forwarding to our project and offering adequate duration in completing our project.

I would like to thank **Dr. N. VASUDEVAN, M.Tech., Ph.D.**, Principal, who gave opportunity to frame the project the full satisfaction.

I whole heartily thanks to **Dr. A. DELPHIN CAROLINA RANI, M.E.,Ph.D.**, Head of the department, **COMPUTER SCIENCE AND ENGINEERING** for providing her encourage pursuing this project.

I express our deep expression and sincere gratitude to our project supervisor **Mr.P.MATHESHWARAN, M.E.,Ph.D.**,Department of **COMPUTER SCIENCE AND ENGINEERING**, for his incalculable suggestions, creativity, assistance and patience which motivated us to carry out this project.

I render our sincere thanks to Course Coordinator and other staff members for providing valuable information during the course.

I wish to express our special thanks to the officials and Lab Technicians of our departments who rendered their help during the period of the work progress.

VISION OF THE INSTITUTION

To serve the society by offering top-notch technical education on par with global standards

MISSION OF THE INSTITUTION

- Be a center of excellence for technical education in emerging technologies by exceeding the needs of the industry and society.
- Be an institute with world class research facilities
- Be an institute nurturing talent and enhancing the competency of students to transform them as all-round personality respecting moral and ethical values

VISION OF DEPARTMENT

To be a center of eminence in creating competent software professionals with research and innovative skills.

MISSION OF DEPARTMENT

M1: Industry Specific: To nurture students in working with various hardware and software platforms inclined with the best practices of industry.

M2: Research: To prepare students for research-oriented activities.

M3: Society: To empower students with the required skills to solve complex technological problems of society.

PROGRAM EDUCATIONAL OBJECTIVES

1. PEO1: Domain Knowledge

To produce graduates who have strong foundation of knowledge and skills in the field of Computer Science and Engineering.

2. PEO2: Employability Skills and Research

To produce graduates who are employable in industries/public sector/research organizations or work as an entrepreneur.

3. PEO3: Ethics and Values

To develop leadership skills and ethically collaborate with society to tackle real-world challenges.

PROGRAM SPECIFIC OUTCOMES (PSOs)

PSO 1: Domain Knowledge

To analyze, design and develop computing solutions by applying foundational concepts of Computer Science and Engineering.

PSO 2: Quality Software

To apply software engineering principles and practices for developing quality software for scientific and business applications.

PSO 3: Innovation Ideas

To adapt to emerging Information and Communication Technologies (ICT) to innovate ideas and solutions to existing/novel problems

PROGRAM OUTCOMES (POs)

Engineering students will be able to:

- 1. Engineering knowledge:** Apply the knowledge of mathematics, science, engineering fundamentals, and an engineering specialization to the solution of complex engineering problems.
- 2. Problem analysis:** Identify, formulate, review research literature, and analyze complex engineering problems reaching substantiated conclusions using first principles of mathematics, natural sciences, and engineering sciences
- 3. Design/development of solutions:** Design solutions for complex engineering problems and design system components or processes that meet the specified needs with appropriate consideration for the public health and safety, and the cultural, societal, and environmental considerations
- 4. Conduct investigations of complex problems:** Use research-based knowledge and research methods including design of experiments, analysis and interpretation of data, and

synthesis of the information to provide valid conclusions

5. **Modern tool usage:** Create, select, and apply appropriate techniques, resources, and modern engineering and IT tools including prediction and modeling to complex engineering activities with an understanding of the limitations
6. **The engineer and society:** Apply reasoning informed by the contextual knowledge to assess societal, health, safety, legal and cultural issues and the consequent responsibilities relevant to the professional engineering practice
7. **Environment and sustainability:** Understand the impact of the professional engineering solutions in societal and environmental contexts, and demonstrate the knowledge of, and need for sustainable development
8. **Ethics:** Apply ethical principles and commit to professional ethics and responsibilities and norms of the engineering practice.
9. **Individual and team work:** Function effectively as an individual, and as a member or leader in diverse teams, and in multidisciplinary settings.
10. **Communication:** Communicate effectively on complex engineering activities with the engineering community and with society at large, such as, being able to comprehend and write effective reports and design documentation, make effective presentations, and give and receive clear instructions.
11. **Project management and finance:** Demonstrate knowledge and understanding of the engineering and management principles and apply these to one's own work, as a member and leader in a team, to manage projects and in multidisciplinary environments.
12. **Life-long learning:** Recognize the need for, and have the preparation and ability to engage in independent and life-long learning in the broadest context of technological change

ABSTRACT

The Insurance Management System is a web-based application developed using HTML, CSS, JavaScript, PHP, and MySQL. This system is designed to modernize and streamline insurance-related processes such as policy creation, premium payments, claim management, and user profile handling. It serves three types of users: customers, administrators, and staff, each with dedicated role-specific features and dashboards to carry out their responsibilities effectively and securely.

The application features a login and registration module that validates users based on credentials stored in a secure MySQL database. Upon successful login, customers can browse available policies, initiate purchases, track payment history, and file insurance claims with supporting information. Staff and admin users can view customer details, monitor claim status, and manage insurance policies and transactions. The system incorporates data validation, session-based authentication, and role-based access control to ensure security and usability.

For database operations, the system utilizes SQL queries for user authentication, data retrieval, updates, and reporting. Tables such as users, policies, claims, and payments are interlinked using relational constraints to maintain consistency. The admin dashboard provides real-time metrics on active policies, premium income, and claim statuses. This project showcases a practical and modular approach to digitizing insurance operations, improving data transparency, reducing administrative errors, and enhancing customer service quality.

ABSTRACT WITH POs AND PSOs MAPPING

ABSTRACT	POs MAPPED	PSOs MAPPED
The Insurance Management System is a web-based application developed using HTML, CSS, JavaScript, PHP, and MySQL. It automates key insurance processes such as policy creation, premium payments, and claim management. The system supports three types of users: customers, staff, and administrators, each with dedicated login and dashboard access. Customers can register, buy policies, pay premiums, and submit claims, while staff and admins manage these activities from their respective panels. The backend database uses normalized tables such as users, policies, claims, and payments. SQL queries handle user authentication, data updates, and report generation. Role-based access and session management ensure security and usability. Admin dashboards provide key metrics like revenue and active policies. Overall, the system improves efficiency, reduces manual errors, and supports digital transformation in insurance management. CHAPTER 1

INTRODUCTION

1.1 OBJECTIVE

The primary objective of the Insurance Management System is to develop a secure, efficient software solution to simplify and automate the core functions involved in managing an insurance company's day-to-day operations. Traditional insurance systems depend heavily on manual records, physical documentation, and offline tracking of customer data, payments, and claims. These outdated approaches are prone to errors, delays, and inefficiencies, making them difficult to scale or manage reliably. This project aims to resolve these issues through a robust online solution that uses PHP for backend logic, HTML/CSS for the user interface, and MySQL as the data storage layer.

The system is built to support three primary user roles: customers, staff, and administrators. Customers can use the application to create an account, log in, purchase insurance policies, view their policy details, pay premiums, and raise claims. The staff role is designed to assist with reviewing claims, checking customer documents, and processing insurance data. Admins can oversee user registrations, manage policy records, review premium payments, and approve or reject claims. The project enforces role-based access, ensuring that users only interact with modules relevant to their responsibility.

Overall, the system provides a centralized and user-friendly interface for managing policies, tracking payments, and resolving customer queries. It supports secure login, persistent data management, and structured reporting. With this solution, insurance providers can improve operational transparency, reduce paperwork, and enhance customer experience.

1.2 OVERVIEW

The Insurance Management System is designed to provide a complete and digital workflow for insurance companies. This system leverages a technology stack comprising HTML, CSS, PHP, JavaScript, and MySQL to enable seamless user interaction and backend operations. The primary objective of the platform is to enable customers to purchase insurance plans, pay premiums, and file claims online, while giving administrative staff tools to manage and monitor system activities in real-time.

Three types of users—Admin, Staff, and Customer—are supported by the system. Each user logs in through a secure authentication module and is directed to their respective

dashboards. The customer dashboard allows users to browse policies, purchase plans, make premium payments, and view or raise claims. The admin and staff dashboards give privileged users access to manage policies, review payments, monitor customer activities, and approve or reject submitted claims. The system interface is responsive, intuitive, and focused on minimizing complexity for all user types.

Modular programming is used to separate concerns such as authentication, data management, and reporting. This makes the application easier to maintain and scale. SQL queries are embedded in PHP to interact with the database for all transactions. Data such as customer profiles, payment records, and claim statuses are stored persistently in MySQL. The project offers real-time updates and facilitates accurate and consistent data handling. Through this, insurance providers can transition from traditional processes to a streamlined digital platform that enhances efficiency and transparency.

1.3 SQL AND DATABASE CONCEPTS

Structured Query Language (SQL) is the foundation for all data manipulation and definition in the Insurance Management System. It is used for creating, modifying, retrieving, and managing the underlying MySQL relational database. The system's database architecture is designed using well-normalized tables to ensure consistency, reduce redundancy, and support scalable data access. The application interacts with the database through SQL queries embedded in PHP scripts, enabling smooth and secure backend operations.

The MySQL database stores vital information including customer profiles, policy types, premium payments, and claim requests. SQL is applied in multiple forms such as DDL (Data Definition Language) for table creation and structure updates; DML (Data Manipulation Language) for CRUD operations (Create, Read, Update, Delete); and DCL (Data Control Language) for managing user permissions. These SQL commands are executed securely to maintain ACID (Atomicity, Consistency, Isolation, Durability) properties of transactions.

DDL commands used include CREATE TABLE to define database tables such as users, policies, claims, and payments; ALTER TABLE for schema modifications; and DROP TABLE for deletion during development testing. Foreign key constraints are used extensively to link user data to their policies, claims, and payments, ensuring referential integrity between the tables. Auto-incrementing

primary keys ensure each record is uniquely identified.

DML commands form the backbone of system interactivity. SELECT is used for retrieving policy lists, user details, and claims; INSERT is used when customers register or submit claims; UPDATE is applied during profile edits or claim status changes; and DELETE allows administrators to remove records if necessary. These operations are all performed after validating input and checking access privileges.

The system maintains a clear relationship structure. The users table includes user_id, username, password (hashed), email, mobile number, and role. The policies table stores policy_id, name, type, term, amount, and coverage. The claims table holds claim_id, user_id, policy_id, reason, date, and status. The payments table tracks payment_id, user_id, policy_id, amount_paid, payment_date, and verification status. All tables are normalized up to 3NF, avoiding duplication and ensuring data efficiency.

Joins are heavily used in the admin dashboard and reporting modules. INNER JOINS and LEFT JOINS combine user data with policy and payment records to provide real-time summaries and status reports. SQL aggregate functions like COUNT(), SUM(), MAX(), and GROUP BY are used to analyze how many policies are sold, how much revenue is generated, and how many claims are processed. These values are displayed as metrics on the admin dashboard.

In addition, indexing is applied to frequently queried fields such as user_id and policy_id to enhance query performance. Views may be created in future enhancements to simplify complex reports. All SQL queries are sanitized using prepared statements or parameterized queries to prevent SQL injection and enhance database security.

Session variables in PHP are also linked to SQL queries to enforce access control. For example, a customer can only view their own claims or payments based on their session ID, preventing unauthorized access to others' data. Admin-level queries have broader access to fetch global statistics and generate comprehensive reports.

In summary, the system demonstrates sound database design principles, secure SQL practices, and optimal use of relational features to ensure a stable, efficient, and scalable backend. The combination of structured SQL usage, normalization, and access control mechanisms supports the robust functionality of the entire Insurance Management System.

CHAPTER 2

PROJECT METHODOLOGY

2.1 PROPOSED WORK

The proposed Insurance Management System is a web-based application developed using PHP as the backend scripting language and MySQL as the database system. The purpose of this project is to automate key insurance processes such as customer registration, login authentication, policy management, premium payment tracking, and claim submission, thereby increasing operational efficiency and reducing manual workload.

The system provides three user roles—admin, staff, and customer—each having a dedicated interface and set of privileges. Customers can register, log in, explore policies, make payments, and raise claims. Admins are responsible for managing users, approving claims, updating policies, and monitoring transactions. Staff members assist with claim verification and reporting. Each module is developed to work independently and in combination with other modules to ensure a consistent and integrated user experience.

The application uses structured routing where user requests are handled through PHP scripts, validated on the server, and then executed with appropriate SQL queries. All transactions are stored and managed in the MySQL database, ensuring accuracy and real-time updates. Frontend interactions are enhanced using HTML and CSS, while sessions are used for login security. The system promotes transparency by providing users with clear access to their data and enabling admins to generate reports based on database content.

Benefits of the Proposed System

1. Minimizes manual effort and paperwork by digitizing insurance operations such as policy claims.
2. Improves customer convenience by enabling users to access and manage their policies online anytime.
3. Reduces human errors through automated data validation, form control, and backend processing.
4. Provides real-time admin dashboards for monitoring policies, claims, and premium collections.
5. Ensures security with session-based access, role verification, and input sanitization.
6. Generates accurate SQL-based reports to support admin decision-making and system analysis.

2.2 BLOCK DIAGRAM

PROPOSED ARCHITECTURE

CHAPTER 3

MODULE DESCRIPTION

3.1. USER LOGIN MODULE

The User Login Module ensures secure authentication and access control across the system. Users provide a username and password which are validated against the records in the users table in the MySQL database. Upon successful authentication, the user is routed to their appropriate dashboard based on their role—admin, staff, or customer. If incorrect credentials are provided, an error message is displayed and login is denied. New users can register through a dedicated sign-up form, and registered users can log in from the home page. Session variables are used to track user authentication status. The system also supports basic security features such as input validation and encrypted password storage. This module forms the gateway to the entire system.

3.2. ADMIN DASHBOARD MODULE

The Admin Dashboard Module serves as the control center for the administrator, enabling centralized oversight and system management. After login, the admin is greeted with a summary view of policy enrollments, payment transactions, and claim statistics. The interface is designed to present actionable insights and navigational buttons clearly. The admin can add, edit, or delete policy records, view customer details, and track claim status. The dashboard also provides access to premium payment logs and reports. Filtering tools allow the admin to sort and search data by policy type, status, or date. Detailed metrics help in reviewing system performance. All actions taken by the admin are logged and tied to their user ID. The design emphasizes clarity, accountability, and efficiency.

3.3. CLAIM MANAGEMENT MODULE

The Claim Management Module allows customers to file insurance claims and enables staff or admin to process them efficiently. Customers submit claims by filling a structured form including policy reference, claim reason, and any necessary descriptions. Submitted claims are stored in the claims table and marked with a default status of "Pending." Admin and staff can view the list of pending claims from their dashboards, where they have the authority to approve or reject each claim. They may also record remarks or reasons for rejection. Once reviewed, the status of the claim is updated and visible to the customer. All actions are logged with timestamps. The module helps ensure a structured and traceable claims workflow.

3.4. CUSTOMER DASHBOARD MODULE

The Customer Dashboard Module gives customers an overview of their insurance engagement. After login, customers are presented with a personalized welcome screen and multiple navigational options. They can view their personal details, active policy list, payment history, and claim status. They can also initiate premium payments or raise new claims directly from this interface. The dashboard is built to be user-friendly and intuitive, ensuring that customers can complete essential tasks quickly. Each customer's data is pulled dynamically from the database using SQL queries based on their session ID. Notifications and alerts for pending payments or claims are also displayed. The interface is designed to keep customers informed and engaged.

3.5. PREMIUM PAYMENT MODULE

The Premium Payment Module handles the tracking and submission of policy-related payments. When a customer purchases a policy, the payment due dates are calculated based on the policy term and recorded in the payments table. Customers can view a list of their pending payments and make updates manually to simulate completion. For each transaction, the payment date, amount, and payment method are stored securely. Admin users can view and export payment logs sorted by user, date, or policy. The module supports payment verification status, allowing admins to mark payments as “Verified” or “Failed.” Customers can also access historical payment data to ensure transparency. SQL queries such as INSERT and SELECT are used to update and retrieve payment records. The system is designed for fast access, ensuring payment data is accurate and traceable for both users and admin staff.

CHAPTER 4

CONCLUSION AND FUTURE ENHANCEMENT

4.1 CONCLUSION

In The Insurance Management System has been successfully developed and tested to meet the functional requirements of an online insurance portal. It integrates essential modules such as login authentication, policy purchase, premium payment, and claim management into a single user-friendly application. The use of PHP and MySQL ensures seamless communication between the frontend and backend while maintaining data integrity and security. The implementation of role-based dashboards for admin, staff, and customers makes system operations more organized and effective.

By enabling digital interaction between users and insurance providers, the system improves accessibility and efficiency. Customers can independently view and manage their policies without the need to visit an office physically. Meanwhile, admin users are equipped with analytical tools and reports that aid in decision-making. The system is designed with scalability in mind so it can accommodate additional modules and future enhancements. SQL joins and queries have been optimized for performance, and the relational schema ensures minimal redundancy. In summary, the system provides a robust and reliable framework for insurance operations in a modern context.

4.2 FUTURE ENHANCEMENT

Although the Insurance Management System effectively fulfills all its current functional requirements, there is significant potential to expand its features and enhance its overall performance, user experience, and operational capabilities. As technology evolves and user expectations grow, incorporating advanced tools and practices into the system will make it more scalable, secure, and user-friendly in the long run.

One of the most impactful future improvements would be the integration of an online payment gateway such as Razorpay, PayPal, or Stripe. Currently, the system uses manual payment status updates. By enabling real-time digital transactions, users would be able to complete premium payments directly through the system interface using credit cards, UPI, net banking, or mobile wallets. This would eliminate the need for manual verification, reduce delays, and provide instant confirmation of transactions. The integration should include payment logs, error handling, and payment status updates for transparency.

Another important enhancement would be implementing an email or SMS notification system. Notifications could be sent automatically to inform customers of upcoming premium due dates, claim status changes, policy expirations, or administrative announcements. This would ensure better engagement, reduce missed payments, and strengthen communication between the insurance provider and customers. Integration with APIs such as Twilio or SMTP-based mailing systems would make this feature reliable and easy to manage.

From a user interface perspective, the current web application could be extended into a responsive design using frameworks like Bootstrap 5 or Tailwind CSS. A mobile-responsive layout would ensure smooth access from smartphones and tablets, making it convenient for customers to manage policies on the go. For even greater accessibility, the system can be developed into a full-fledged mobile application using Flutter or React Native, offering push notifications and offline access where feasible.

For administrators and management staff, advanced reporting tools could be added. Currently, basic SQL reports are provided for policies, claims, and payments. However, integrating graphical dashboards using libraries such as Chart.js or Google Charts could help visualize trends, revenue growth, claim frequency, and customer acquisition patterns. Data could be grouped and analyzed using filters like date ranges, policy types, or customer demographics. This will support more strategic decision-making.

In terms of data security and verification, future versions of the system could include multi-factor authentication (MFA) during login, such as OTP-based verification. Furthermore, integrating national ID APIs like Aadhaar (in India) could provide seamless KYC (Know Your Customer) verification, reducing the risk of fraud and improving the reliability of customer identity during registration and claims.

The system could also be extended to support multilingual functionality, which would make it more inclusive and suitable for diverse user groups. Language preferences could be saved per user and the frontend labels dynamically updated to match their selected language.

In conclusion, the Insurance Management System has a strong foundational structure that can easily accommodate future upgrades. By integrating real-time payments, automated alerts, mobile compatibility, visual dashboards, security upgrades, and intelligent analytics, the system will evolve into a comprehensive, customer-centric platform that meets the demands of modern insurance administration.

APPENDIX B

HOME PAGE:

REGISTER PAGE:

The screenshot displays the registration page of the Insurance Management System. On the left, the "Insurance Management System" logo is shown above a dark square icon containing a white "ID" symbol. On the right, the "IMS" logo is at the top, followed by the heading "Get Started" and the subtext "It's free to signup and only takes a minute." Below this, there are several input fields: "Full Name" (with a placeholder "Enter your Full Name"), "Contact Number" (with a placeholder "Enter your Contact Number"), "Email id" (with a placeholder "Enter your Email"), and "Password" (with a placeholder "Enter your password"). A "Confirm Password" field is also present, with a placeholder "Repeat Password". A "Gender" dropdown menu is set to "Male". A blue "Create Account" button is located below the password fields. At the bottom right, there is a link "Already have an account? Sign In" and a small circular icon.

LOGIN PAGE:

The screenshot shows the login page of the Insurance Management System. The "Insurance Management System" logo is at the top left, followed by the text "Welcome back!" and "Please sign in to continue". Below this, there are two input fields: "Email" (with a placeholder "Enter your email") and "Password" (with a placeholder "Enter your password"). A blue "Sign In" button is positioned below the password field. At the bottom, there are two links: "Forgot password?" and "Don't have an account? Create an Account".

ADMIN PAGE:

The Policy Form is used to create new insurance policies. It includes a sidebar menu and a main form area titled "Policy Form !". The form contains the following fields:

- Category ***: A dropdown menu with "Select Category" as the placeholder.
- Sub Category Name ***: A dropdown menu with "Select Sub Category" as the placeholder.
- Policy Name ***: A text input field.
- Sum Assured ***: A text input field.
- Premium ***: A text input field.
- Tenure ***: A text input field.

A blue "Submit" button is located at the bottom right of the form.

The Manage Insurance Policy Form displays a table of existing policies. The table has the following columns: S.NO, POLICY NAME, CATEGORY NAME, SUBCATEGORY NAME, SUM ASSURED, PREMIUM, TENURE, CREATION DATE, and ACTION.

S.NO	POLICY NAME	CATEGORY NAME	SUBCATEGORY NAME	SUM ASSURED	PREMIUM	TENURE	CREATION DATE	ACTION
1	Jeevan Sathi	Health Insurance	Health Maintenance Organization (HMO) plans	500000	500	12	2022-11-27 22:59:32	Edit Insurance Policy Form
2	Jeevan Dhara	Life Insurance	Term Plan	800000	500 p/m	10	2022-11-27 22:59:32	Edit Insurance Policy Form
3	Accidental Policy	Vehicle Insurance	Personal Injury Coverage	200000	100 p/m	12	2022-11-27 23:01:45	Edit Insurance Policy Form
4	Bharti AXA	Marine Insurance	Freight, Damage and Defense (FDD) Insurance	700000	800 p/m	8	2022-11-27 21:09:24	Edit Insurance Policy Form
5	Bajaj Allianz	Health Insurance	Exclusive Provider Organization (EPO) plans	500000	4250	15	2022-11-27 20:00:10	Edit Insurance Policy Form
6	ICICI Lombard	Crop Insurance	Group Risk Plan	1000000	54244	15	2022-11-27 20:40:40	Edit Insurance Policy Form
